FEATURES

- Note: Prerequisite for this set are the basic program SET-01 Base and SET-32 Count
- ET Inventory: SET-52 Inventory is an assistance program and database, which enables users without any previous knowledge to carry out stock-take processes quickly and without errors. Users concentrate solely on identifying the stock-take objects, e.g. by scanning the barcode, while the program handles the entire counting process independently
- Simple process: The process is remarkably easy: Scan the barcode, place the object on the balance and you're done. Then go straight on to the next item
- Organising the stock-take: Each stock-take can be divided into different "jobs" – depending on the storage location, product group, etc. Each stock-taking job is carried out, completed and saved individually. This makes it possible to divide large stock-takes into meaningful subsections and have them processed by different teams
- Authorisation process: Stock-takes can include an authorisation process so that the results have to be authorised by an authorised user role when the process has been completed
- Stock list: EasyTouch outputs a clear list of all recorded items with the counted stock for each item. It is possible, for example, to compare a current stock-take with the stock-take from the previous year. The system then calculates the stock differences between the two stock-takes automatically
- ERP Connect: With this optional extension, stock lists can be imported from existing order management systems for example and results, including current stock levels, can be exported back to the system
- Weighing and counting: The stock value can either be taken from the balance as a count result, can be entered by hand or taken from a comparison stock-take
- Data import: The master data for the stock-take item can be imported into EasyTouch either from an ERP system using an interface, or from an Excel list

License information
- Licensing: One license can be operated on one terminal device (PC, laptop, Android-tablet)

PLEASE NOTE FOR YOUR ORDER

- Prerequisite for this set are the basic program SET-01 Base and SET-32 Count

Option

KERN Pictogram Overview

	EasyTouch: Suitable for the connection, data transmission and control through PC or tablet
	Central user administration for KERN EasyTouch functions. Primary master data, for example, first name, surname, image, is stored for a user. Each user is assigned a user role, which has individually configurable permissions in the KERN EasyTouch App. Through this structure you can create standard users, supervisor users, etc. You can log into the KERN EasyTouch App with a user name and a password.
	All printed and stored weighing and measuring data is stored in this memory. The data is stored either on the local display device or centrally – for all connected weighing systems – in a server directory (Save-Data Server or Save-Data Cloud). Dynamic data can be recalled and printed out at any time and/or exported as a table.
	All stored data is saved in a tamper-proof manner. Changes to master data are also saved in the dynamic data memory in a tamper-proof manner (Data Traceability)
	Device qualification: standard-compliant qualification concept, which includes the following validation services: Installation qualification (IQ), function qualification (OQ)
	Central data memory function for additional storage of all measuring data in a central, local server directory. This is where measuring data is stored from all weighing systems connected using KERN EasyTouch, as well as all installed KERN EasyTouch functions. The advantage of this, particularly for users with several weighing systems, is having all weighing data consolidated in just one database and only having to search for individual measuring data from different balances in one table. Save-Server data storage is also tamper-proof and cannot be changed.
